Background:	This gene encodes a member of the tripartite motif (TRIM) family. The TRIM motif includes three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a co

iled-coil region. This protein localizes to the nuclear matrix . It interacts with the enhancer of polycomb protein and r epresses gene transcription. It is also thought to be involv ed in the differentiation of male germ cells. Fusion of the N-terminus of this protein with the truncated C-terminus of the RET gene product has been shown to result in pro duction of the ret transforming protein.
