## 技术规格

Background:	The WNT gene family consists of structurally related ge nes which encode secreted signaling proteins. These pr oteins have been implicated in oncogenesis and in seve ral developmental processes, including regulation of cell fate and patterning during embryogenesis. This gene is a member of the WNT gene family. It encodes a protei n which shows 94% and 80% amino acid identity to th e mouse Wnt5b protein and the human WNT5A protei n, respectively. Alternative splicing of this gene generat es 2 transcript variants.
