技术规格

Background:	This gene encodes a preproprotein, which is processed to yield both alpha and beta chains, which subsequently combine as a tetramer to produce haptoglobin. Haptoglobin functions to bind free plasma hemoglobin, which allows degradative enzymes to gain access to the hemoglobin, while at the same time preventing loss of iron through the kidneys and protecting the kidneys from damage by hemoglobin. Mutations in this gene and/or its regulatory regions cause alpha hemoglobinemia or hypohaptoglobinemia.
Applications:	ELISA, IHC
Name of antibody:	HP
Immunogen:	Synthetic peptide of human HP
Full name:	haptoglobin
Synonyms :	BP; HPA1S; HP2ALPHA2

SwissProt:	P00738
ELISA Recommended dilution:	2000-10000
IHC positive control :	Human thyroid cancer and Human gastric cancer
