### 技术规格

<b>Background:</b>	This gene encodes a major heat shock protein which functions as a chaperonin. Its structure consists of a heptameric ring which binds to another heat shock protein in order to form a symmetric, functional heterodimer which enhances protein folding in an ATP-dependent manner. This gene and its co-chaperonin, HSPD1, are arranged in a head-to-head orientation on chromosome 2. Naturally occurring read-through transcription occurs between this locus and the neighboring locus MOBKL3.
<b>Applications:</b>	ELISA, IHC
<b>Name of antibody:</b>	HSPE1
<b>Immunogen:</b>	Synthetic peptide of human HSPE1
<b>Full name:</b>	heat shock 10kDa protein 1
