### 技术规格

<b>Background:</b>	This gene encodes a member of the interferon regulatory transcription factor (IRF) family. The encoded protein is found in a n inactive cytoplasmic form that upon serine/threonine phosphorylation forms a complex with CREBBP. This complex translocates to the nucleus and activates the transcription of interferons alpha and beta, as well as other interferon-induced genes. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene.
