技术规格

Background:	The protein encoded by this gene is erythrocyte-specific and is thought to be part of a membrane channel that transports ammonium and carbon dioxide across the blood cell membrane. The encoded protein appears to interact with Rh blood group antigens and Rh30 polypeptides. Defects in this gene are a cause of regulator type Rh-null hemolytic anemia (RH N), or Rh-deficiency syndrome.
Applications:	ELISA, WB, IHC
Name of antibody:	RHAG
Immunogen:	Fusion protein of human RHAG
Full name:	Rh associated glycoprotein
