技术规格

Background:	The Fos gene family consists of 4 members: FOS, FOSB, FOSL1, and FOSL2. These genes encode leucine zipper proteins that can dimerize with proteins of the JUN family, thereby forming the transcription factor complex AP-1. As such, the FOS proteins have been implicated as regulators of cell proliferation, differentiation, and transformation. In some cases, expression of the FOS gene has also been associated with apoptotic cell death.
Applications:	WB
Name of antibody:	FOS(Phospho-Ser362)
Immunogen:	Peptide sequence around phosphorylation site of serine 362 (K-G-S(p)-S-S) derived from Human Fos.
