### 技术规格

#### Background:

The protein encoded by this gene is a DNA-binding transcription factor and is a member of the NR1 subfamily of nuclear hormone receptors. The specific functions of this protein are not known; however, studies of a similar gene in mice have shown that this gene may be essential for lymphoid organogen

	<p>esis and may play an important regulatory role in t hymopoiesis. In addition, studies in mice suggest t hat the protein encoded by this gene may inhibit t he expression of Fas ligand and IL2.</p>
