### 技术规格

<b>Background:</b>	This gene encodes a member of the steroid-thyroid hormone-retinoid receptor superfamily. Expression is induced by phytohemagglutinin in human lymphocytes and by serum stimulation of arrested fibroblasts. The encoded protein acts as a nuclear transcription factor. Translocation of the protein from the nucleus to mitochondria induces apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene.

<b>Name of antibody:</b>	NR4A1(Ab-351)
<b>Immunogen:</b>	Synthesized non-phosphopeptide derived from human Nuclear Receptor NR4A1 around the phosphorylation site of serine 351 (L-P-S(p)-K-P).
<b>Full name:</b>	nuclear receptor subfamily 4, group A, member 1

<b>Synonyms :</b>	nuclear receptor subfamily 4, group A, member 1
