技术规格

Background:	This gene is a member of the family of dihydroxyacetone kinases, which have a protein structure distinct from other kinases. The product of this gene phosphorylates dihydroxyacetone, and also catalyzes the formation of riboflavin 4',5'-phosphate (aka cyclin F MN) from FAD. Several alternatively spliced transcript variants have been identified, but the full-length nature of only one has been determined.
Applications:	ELISA, WB, IHC
Name of antibody:	TKFC
Immunogen:	Fusion protein of human TKFC
